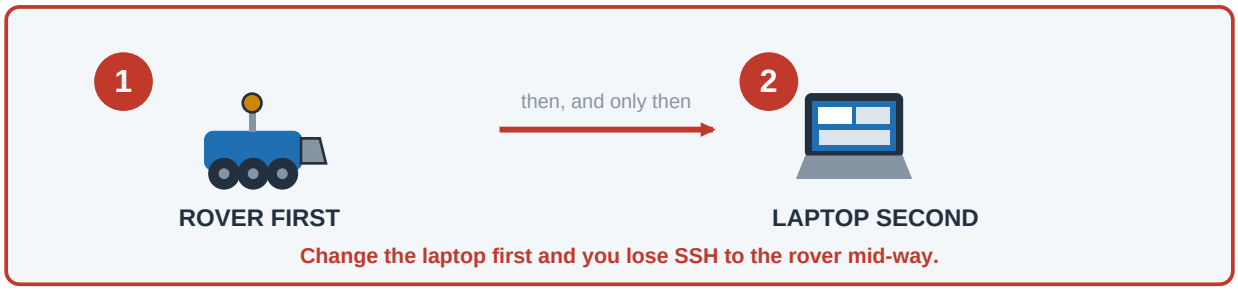
If the arena Wi-Fi name changes

Two commands per machine · nothing else changes · October 2026



1 · On the ROVER (ssh agazhvan2@192.168.2.20)

```
sudo nmcli con modify Team_1 \
    802-11-wireless.ssid "Team_7" \
    wifi-sec.psk "<new-password>"
sudo nmcli con up Team_1
```

2 · On the LAPTOP

```
sudo nmcli con modify Team_1 \
    802-11-wireless.ssid "Team_7" \
    wifi-sec.psk "<new-password>"
sudo nmcli con up Team_1
```

*Replace **Team_7** and the password with the real ones. Keep the profile NAME as **Team_1** — only the **ssid** field has to match the air.*

Then check

```
ip -br addr # .20 on rover, .50 on laptop
ping 192.168.2.20 # from the laptop
rover-dds-check # on BOTH machines
```

Why nothing else needs changing

The Wi-Fi name exists in **exactly two places** — those two profiles. Not in the UI config, not in either DDS config, not in any startup file. Everything else is keyed on **192.168.2.20** and **192.168.2.50**, and those addresses are **ours**, not the router's — so the two machines keep talking even if the arena router hands out a completely different range.

*Being forced onto automatic addresses is the one thing that would break this: the addresses move and the machines lose each other. **Keep both ends fixed.** · **Locked out?** Plug a monitor and keyboard into the Jetson and run the same two lines there — nothing is lost, the services come back on their own.*
